AMR – a Global Threat

AMR: Antimicrobial Resistance

Antibacterial-drugs have had a powerful impact on the treatment of bacterial infection. However, in recent years, drug-resistant bacteria which are ineffective to antibacterial-drugs are spreading. It is becoming a global threat. If these drug-resistant bacteria increase, infections become more severe, and may even be fatal.

Through measures such as promoting the proper use of antibacterial-drugs, we are working to prevent the increase of, and to reduce, these drug-resistant bacteria.
